apparently the Condenser discharges a reverse charge thro relay & kills the residual magnetism

With or without reason, putting on Condenser ~~discharges~~ makes relay work sharp & an adjustment that the relay should ~~not~~ absolutely (1 c) absent 2 sec after opening or ordinary breakage with key 4 seconds for relay disch

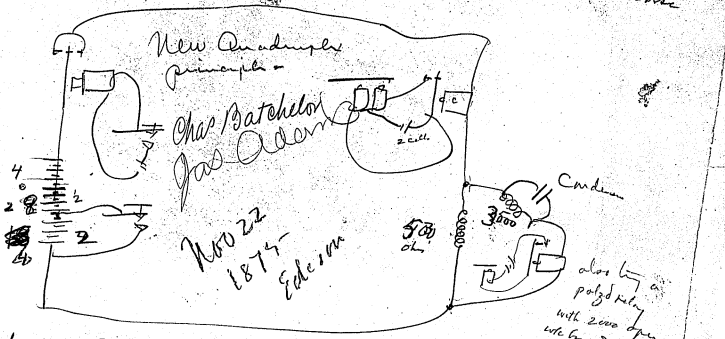
weight at x dent
wire any wire =
but on clamp
Relay Key the grip
makes the down stroke
when under pen upon
the other journ makes
the back stroke

I think that if the back point relay C had a second [illegible] with a second [illegible] coil so as to by-shunt the permanent current it might work both through it might increase a current + make it more



With 1000 ohms in Condenser R not very good but both [illegible] than none or worn used in Condr used, but when the made 3800, the dead open relay works perfectly splendid and the back point relay works better than when reversed Currents are used although the arrangement is a grand success

6

Thus works perfectly, spring out of a spring of a is to a dynamic Unit of ohms & Ohms in a great line, relay b open to close "each" forward backward impulses of line, (a and c) are from shunts as shunts when beautiful, The total breakage loss not more ⓒ as fast as necessity, shunts to work R Cards works at worse
